I] Write down the detailed procedure to assemble a system.

Ans. Step 1: Remove Side panels on case

After removing the case from the box, the panels are removed from this case with thumbs screws. Our specific model's manual will have more information.

Step 2: Insert motherboard

Depending on the motherboard, case, CPU and CPU fan, we need to install the CPU cooler must be installed before or once in place.

Step 3: Check clearances

Being that the computer includes high performance components, some of them are large enough that the clearance can become an issue.

Step 4: Front Panel Connection

It's time to attach the connection for the button, lights, USB port and audio connections.

Step 5: Install power supply

The supply is screwed into the back panel by 4 screws.

Step 6: Power Motherboard

Motherboard power is the largest cable, so run the cable first and plug it into the board.

Step 7: Installing Optical drive

The optical drive is a DVD/CD read/write combo.

Step 8: Installing the Hard drives

The size and number of hard drives is dependent on our use and storage needs.

Step 9: Connect cables

We need to connect cables for hard drives and optical drives.

Step 10: Install RAM

We need to now insert the RAM. The slots are keyed as are the RAM sticks and ensure that the notch is lined up.

Step 11: Install Graphics card and expansion cards

We need to add additional cards if the computer does not come with a graphics card integrated into motherboard.

Step 12: Cable Management

Hiding cables and organising them will help in the future if we are looking for airflow.

Step 13: Final product

The assembly of brand new system is completed, it is time to fire it up and enjoy our creation.

Q] Explain how troubleshooting a system helps to trace and correct the failure in the system.

Ans. Troubleshooting means error rectification by diagnosing the source or sources of the error or problem. It involves both identification and fixing of mostly software problems or failures in a system, by following procedure step by step.

Troubleshooting approach requires one to be simplistic in their approach and not go all critical suddenly since

troubleshooting is applied when a system suddenly stops working, so the best approach is to start from the basic and then slowly climb up to more complex problem solving strategies.

Step 1: for troubleshooting involves to detect what exactly the problem is. Getting to the bottom of a computer issue can sometimes feel like dealing with lot of questions at a time, so we need to ask the right questions first if we want to discover the root problem quickly.

Step 2: It is important to gather more details and to eliminate variables. In many instances, what was reported as a general issue (eg: the internet is down) is actually something very particular, such as a specific website being offline. We need to ask the pertinent questions and then dig up more information from various sources such as error messages, error logs, providing screenshots, diagnostics results.

Step 3: It is important to reproduce the problem, develop hypothesis of root cause. After gathering basic background information, it's time to get hands-on with the problem.

Step 4: Attempt to find the solution based on the findings. The evidence we have already gathered should have narrowed down possible root causes and positioned to fix the issue.

By gaining in depth knowledge of a system's working and the working of individual components one can establish procedure to nail the source of problem and its fixation

3) List out the procedure to install extra memory card to the system.

Ans: Step 1: Select the RAM that is compatible with the computer. Consult the owner's manual for your computer or motherboard to determine the correct RAM type.

Step 2: Remove the cover or access panel from your computer. Most computers will have thumb screws, Philip screws or push buttons to open the case. Locate the screws or buttons and remove the access panel or door.

Step 3: Locate the RAM slot

Most standard desktop computers will have two, four or six slots. They are often grouped together and at least one of the available slots will already contain a memory module, as you must have RAM fitted to your computer for it to boot. In newer machines the RAM slot will be coloured. It is best to fill each colour first rather than showing the RAM.

Step 4: Insert the RAM

Apply the necessary pressure and keep pushing until you hear a click or the holding tabs on either side snugly into the indentations in either side of the module.

4] With a neat diagram, explain different cable used to connect functional units in a system.

Ans.

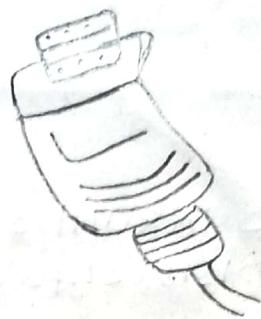

1. VGA Cable: Also known as D-sub cable, analog video cable. Connect one end to computer, monitor, television. Connect the other end to VGA port on computer.
2. DVI Cable: Connect one end to computer monitor. Connect other end to DVI port on computer.
3. HDMI Cable: Connect one end to computer, monitor, television. Connect other end to HDMI port on computer.
4. PS/2 Cable: Connect one end to PS/2 keyboard, PS/2 mouse. Connect other end to PS/2 ports on computer. Purple PS/2 port: keyboard. Green PS/2 port: mouse.
5. Ethernet Cable: Connect one end to router, network switch. Connect other end to ethernet port on computer.
6. USB Cable: Connect one end to USB device. Connect other end to USB ports on computer.
7. Computer Power Cable: Connect one end to AC power socket. Connect other end to power supply unit, computer monitor.

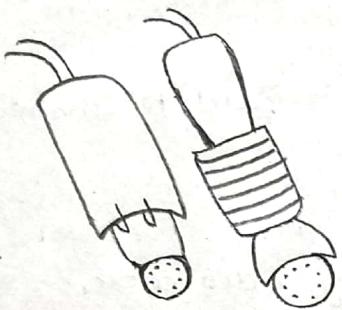

1. VGA Cable

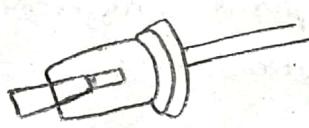

2. DVI Cable

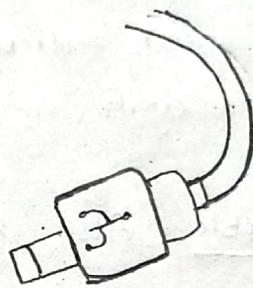

3. HDMI Cable

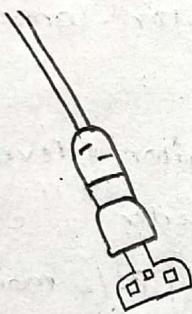

4. PS/2 Cable

5. Ethernet Cable

6. USB Cable

7. Computer Power Cord

5] Discuss the safety precautions one should take while removing the components of a system.

Ans.

1. Fully shutdown and unplug the computer before you make any attempts to disassemble the tower
2. Take off any metal objects on your ~~arms~~ or fingers such as bracelets, rings or watches. Even if your unit is unplugged, there may still be some remaining electric charge.

3. Make sure your hands are completely dry to avoid damaging any mechanical parts as well as to avoid electrocution.
4. Work in a cool area to avoid perspiration for the same reason as sun in the previous number
5. Before touching any part within the tower, put your hands against another metal surface to remove static charge, which may damage sensitive devices.
6. Prepare a place to keep any screws you may remove. A container or piece of paper may remove which labels for each part is ideal to avoid confusion between the similar looking screws.
7. Handle all parts with care. Place each piece you remove carefully down onto a stable surface.
8. If a component does not come out easily, do not remove it forcefully.
9. Be careful when handling the motherboard.
10. Never attempt to remove the power source, a box attached to the side or bottom of the unit to which all cables are connected.
11. When removing any cables, wires or ribbons, make sure to grasp the wire at the base or head to keep it from breaking.
12. Be careful not to drop any small parts into unreachable areas such as into the computer fan or disc drive.
13. Take note that the three most damaging things to a computer are moisture, shock and dust.

Tutorial -II

Programme: B.E

Course: Computer Organization Course Code: CS45

Term: Jan to May 2020

Name: SUKRUTH.S	Marks: 10 /10	Date: 28/01/2020
USN: IMSI18CS142	Signature of the Faculty:	OP/2020

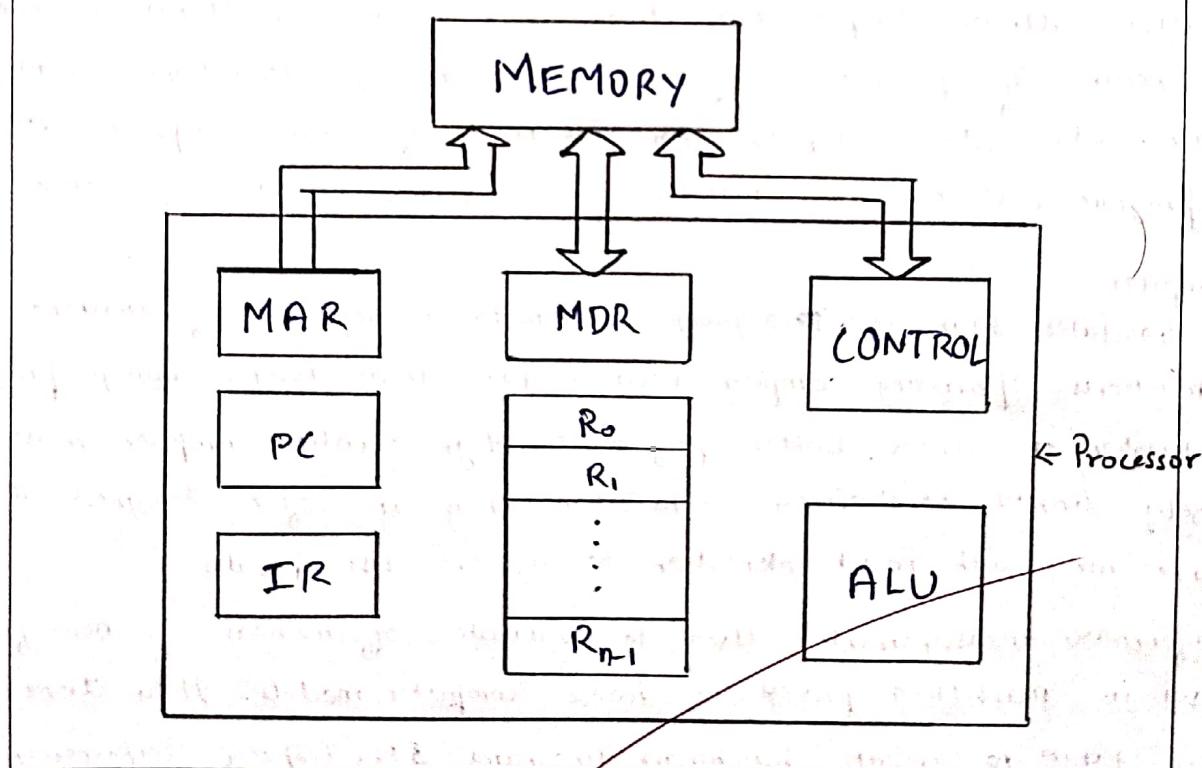

Activity II: Demonstrating Datapath and instruction execution stages using MarieSim Simulator

Objective: To simulate inter communication between CPU and memory.

Simulator Description: MarieSim is a computer architecture simulator based on the MARIE architecture. It provides users with interactive tools and simulations to help them deepen their understanding of the operation of a simple computer. One can observe how assembly language statements affect the registers and memory of a computer system.

Activity to be performed by students:

1. Draw the interconnection between memory and a processor.

2. List out the steps required to execute an instruction.

3. Write and execute assembly language program to compute

- i) $f = (g+h)*(i+y)$
- ii) $d = b^2 - 4ac$

4. Describe the factors affecting the performance of a processor

2. 6 steps : (i) Fetch instruction

(ii) Decode instruction

(iii) Perform ALU operation

(iv) Access memory

(v) Update register file

(vi) Update program counter

3. (i) LOAD G G, DEC 5

ADD H H, DEC 4

STORE A I, DEC 3

LOAD I Y, DEC 2

ADD Y A, DEC 0

STORE B B, DEC 0

LOOP, LOAD A

ADD B

STORE F

HALT

3. Results and Snapshots:

4.(i) Processor clock: Processor circuits are controlled by a clock - it is a timing signal called clock. Clock defines regular time intervals - clock cycles. To execute a machine instruction, the processor divides the action to be performed into a series of basic steps, each completed in 1 clock cycle. Length P of one clock cycle is important for processor performance, whose inverse is the clock rate, $R = 1/P$ cycles/sec calculated in Hertz.

(ii) Basic Performance equation $T = \frac{N \times S}{R}$, where
 T = Processor time
 N = No. of machine language instructions
 R = Clock rate
 S = No. of basic steps to execute instruction

For high performance, reduce T by reducing N & S and increasing R .

(iii) Pipelining and Superscalar operation: Pipelining is the overlapping execution of several instructions. This reduces number of clock cycles, we can achieve a higher degree of concurrency. Parallel paths are created. Execution of several instructions in every clock cycle is called superscalar execution.

(iv) Clock rate: 2 possibilities to increase clock rate R is improving the Integrated circuit technology which makes logic circuit faster, which reduces the time needed to complete a basic step. Reducing the amount of processing done in one basic step also makes it possible to reduce the clock period P .

(v) CISC and RISC

RISC allows simple instructions which require small no. of basic steps to execute. If program will have more no. of instructions i.e., $N = \text{max}$, $S = \text{min}$. CISC are complex, more number of basic steps to execute. A program will have less number of instructions i.e., $N = \text{min}$, $S = \text{max}$.

(vi) Compiler

Translates high level language program to a sequence of machine instructions. Optimising compiler reduces $N \times S$, may rearrange program instruction to achieve better performance. High quality compiler must be closely linked to processor architecture, they are often designed at the same time, with much interaction to achieve best results.

(vii) Performance measurement: Used to evaluate effectiveness of new features, used in marketing process, to choose computer models. It is done using time taken to execute benchmark programs. SPEC (Specific Performance Evaluation Corporation) SPEC rating = $\frac{\text{running time on reference computer}}{\text{running time on computer under test}}$

$$\text{SPEC rating} = \left(\prod_{i=1}^n \text{SPEC}_i \right)$$

Objective: To simulate ARM Instruction set using ARMSim simulator.

Simulator Used: ARMSim 1.91 is a desktop application running in a Windows environment. It allows users to simulate the execution of ARM assembly language programs on a system based on the ARM7TDMI processor.

ARM enables the users both to debug ARM assembly programs and to monitor the state of the system while a program executes.

Activity to be performed by students:

- 1) Write an ARM program to perform basic arithmetic operations.
- 2) Write an ARM program to demonstrate the working of load and store instructions.
- 3) Write an ARM program to evaluate expression $f=(g+h)-(i+j)$
- 4) Write an ARM program to find the sum of all elements of an array.
- 5) Write an ARM program to find the factorial of a number.

Programs and the snapshots:

**Ramaiah Institute of Technology
(Autonomous Institute, Affiliated to VTU)**

Department of CSE

Programme: B.E

Course: Computer Organization

Term: Jan to May 2019

Course Code: CS45

Activity IV: Executing ARM programs using ARMsim simulator.

Name: SUKRUTH.S.	Marks: /10	Date: 11/02/19
USN: 1MS18CS142	Signature of the Faculty:	

Objective: To simulate ARM Instruction set using ARMsim simulator.

Simulator Used: ARMSim 1.91 is a desktop application running in a Windows environment. It allows users to simulate the execution of ARM assembly language programs on a system based on the ARM7TDMI processor.

ARM enables the users both to debug ARM assembly programs and to monitor the state of the system while a program executes.

Activity to be performed by students:

- 1) Write an ARM program to generate Fibonacci Series.
- 2) Write an ARM to search an element in an array and print Y if found and print N if not found.
- 3) Write an ARM program to find the length of a string and copying one string to another.

```
l> MOV R0, #0
    MOV R1, #1
    MOV R2, #6
    MOV R4, #0x00001000
    MOV R5, #0
loop: ADD R3, R0, R1
    MOV R0, R1
    MOV R1, R3
    SRR R3, [R4, R5]
    ADD R5, R2, #1

**Ramaiah Institute of Technology
(Autonomous Institute, Affiliated to VTU)**

Department of CSE

Programme: B.E

Term: Jan to May 2019

Course: Computer Organization

Course Code: CS45

Activity V: Designing an ALU to perform arithmetic and logical functions using Logisim simulator.

Name: SUKRUTH S	Marks: /10	Date: 22/05/2020
USN: 1MS18CS142	Signature of the Faculty:	

Objective: To simulate the working of Arithmetic and Logical Unit using simulator.

Simulator Description: Logisim is an educational tool for designing and simulating digital logic circuits. With its simple toolbar interface and simulation of circuits as you build them, it is simple enough to facilitate learning the most basic concepts related to logic circuits. With the capacity to build larger circuits from smaller sub circuits, and to draw bundles of wires with a single mouse drag, Logisim can be used (and is used) to design and simulate entire CPUs for educational purposes.

Activity to be performed by students:

List out the steps in designing ALU

SUKRUTH.S

IMS18CS142

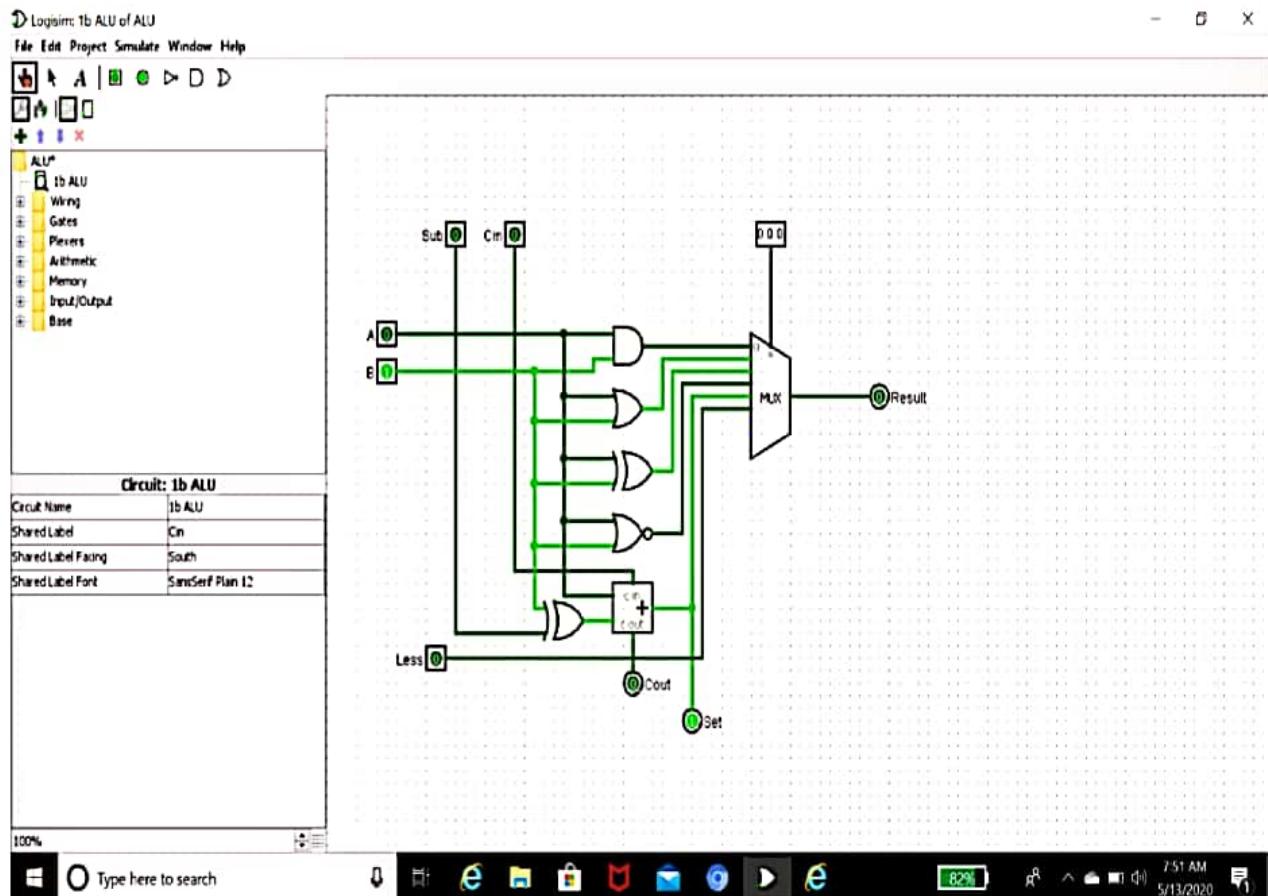

4th "B"

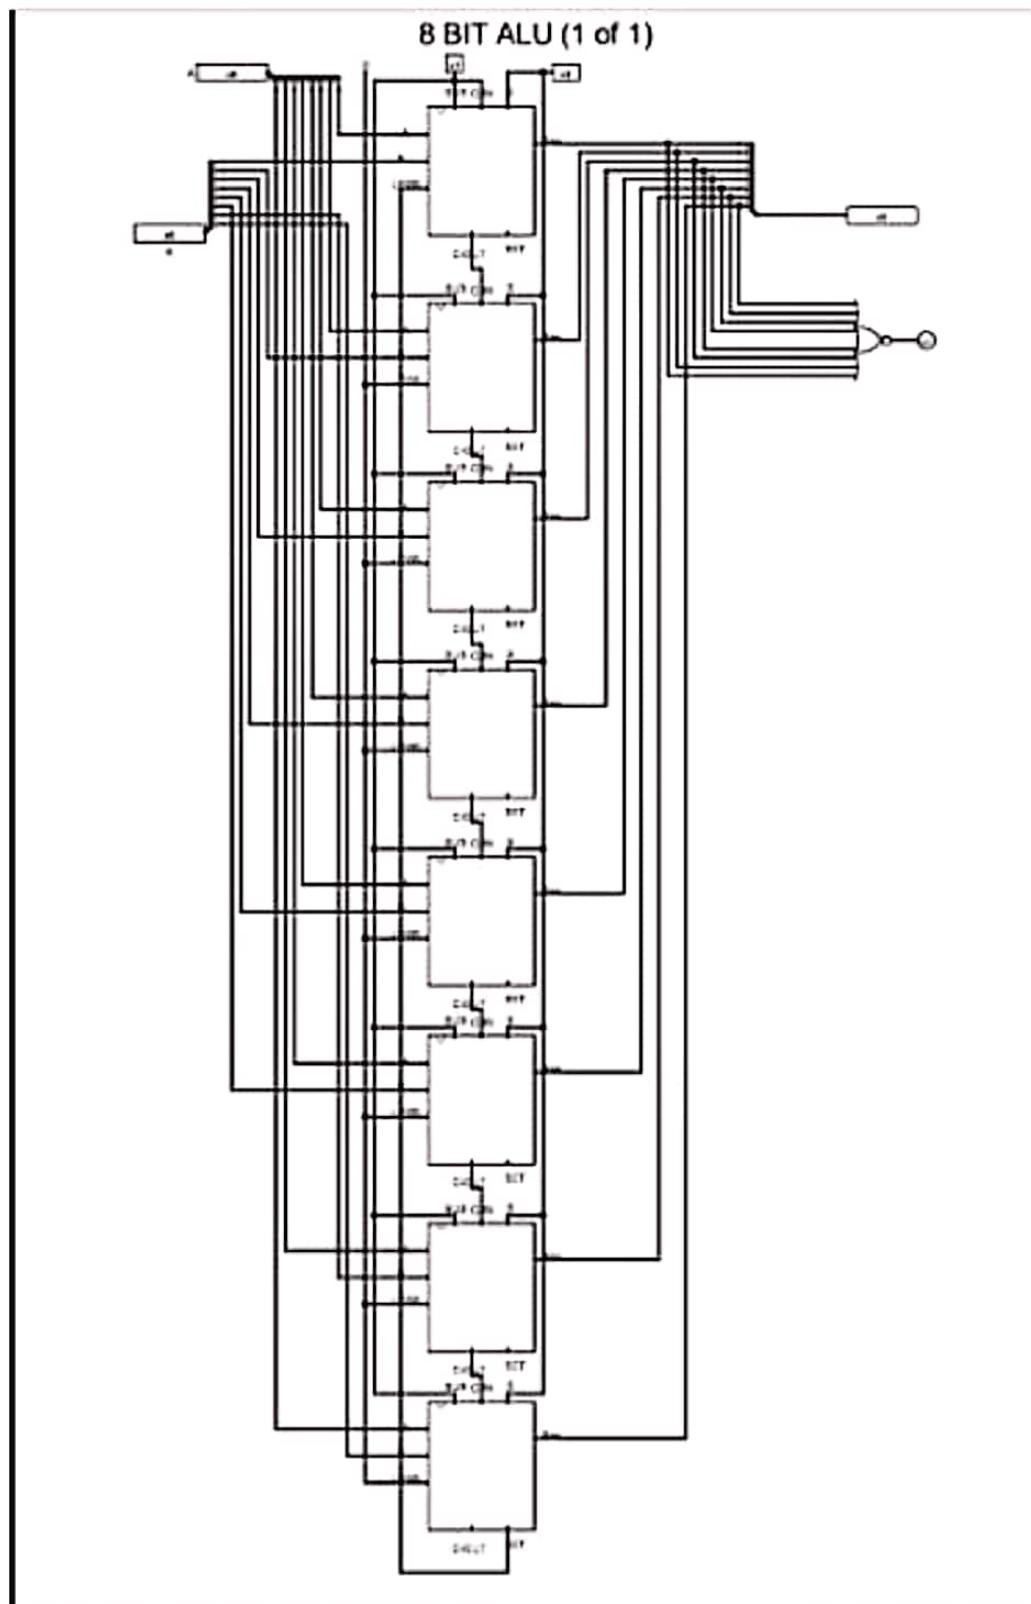

COMPUTER ORGANISATION [CS45]

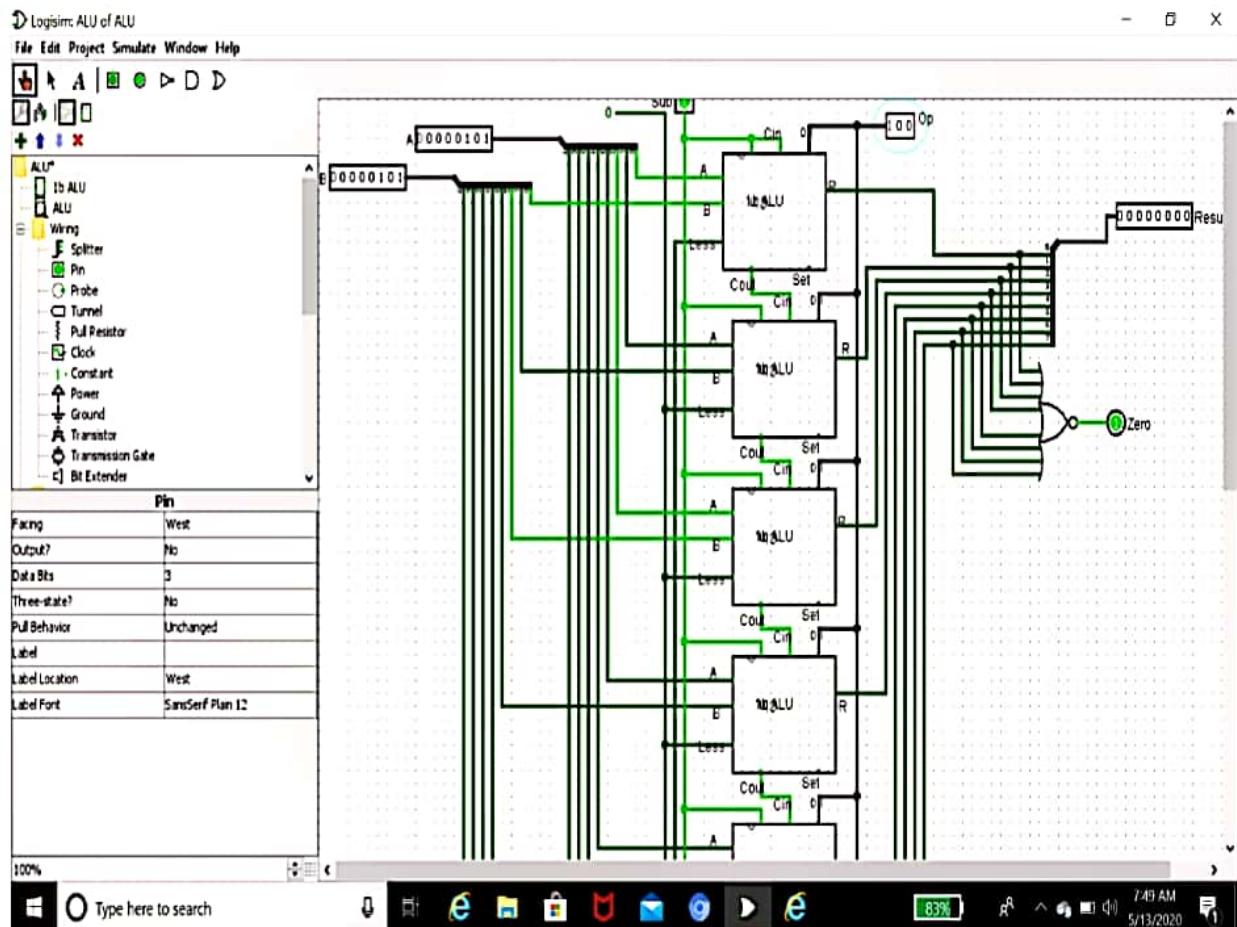

LAB - 5

List out the steps in designing the ALU

- ① Place 2 pins A and B (input pins)
- ② Connect the input pins to an AND gate
- ③ Similarly connect A and B to an 'OR' gate, 'XOR' gate and 'NOR' gate and add a 1-bit adder
- ④ Place a multiplexer with 3 select bits.
- ⑤ Connect the outputs of all the gates to the MUX and a 3 bit input pin to the MUX.
- ⑥ Connect the output of the MUX to the output pin and name the output pin as 'Result'
- ⑦ Connect an input pin (C_{in}) to the 1-bit adder and an output pin (C_{out}) to the 1-bit adder
- ⑧ Connect another input pin ('sub') to an EXOR gate and the output of it to the C_{out}
- ⑨ Connect an input pin (L_{eq}) to the MUX for comparisons
- ⑩ Connect an input pin (set) to the output of the 1-bit adder which is in-turn connected to the Mux.

COMPUTER ORGANISATION [CS45]

LAB - 6

List out the steps in designing memory system

- 1] Add a RAM with separate load and store selected
- 2] Place a counter and connect it to the RAM
- 3] Connect a clock to a controlled buffer and the output of it to the RAM
- 4] Connect an input pin to that buffer.
- 5] Place another controlled buffer and give an input from the input pin and also from the clock.
- 6] Now add a 7-bit random generator and connect Q to D of the RAM.
- 7] Connect the 'D' from RAM to a TTY unit to display
- 8] Connect another input from the second controlled buffer to the TTY
- 9] Connect a RESET button to the counter.
