## Activity - I

Name :	Moulidhar .B	Branch:	CSE
USN/Roll No. :	1MS18CS075	Sem/Sec:	IV B
Subject :	Computer organization & Architecture	Subject Code:	

- ① Write the detailed procedure to assemble a system

Ans:- ① Remove side panels on case:- After removing the case from the box, the panels are removed from this. Case with thumb screws.

② Insert motherboard:- In assembly process, as I was just transferring the parts from one case to another, leaving the CPU cooler installed was the easiest option. Depending on the motherboard, case, CPU and CPU fan, this might need to be done before installing or once in place.

③ Check clearances:- Being that this computer includes high performance components, some of them are large enough that clearance can become an issue.

④ Frontpanel connections:- Once the graphics card was removed again, it is time to attach the connections for the battery, light, USB ports & audio connections.

⑤ Install Power Supply:- The powersupply from the previous case was modular so only the cables that are needed are plugged into the unit.

6. Power motherboard:- with the motherboard power being the largest cable and sometimes just long enough, running this cable first and plugging it into the board, if there is a second cable for the CPU remember to connect it as well.
7. Installing optical drive:- The optical drive for this computer is a CD/DVD read/write combo.
8. Installing the hard drives:- The size and number of hard drives your computer contains is completely dependent on your style of use and storage needs.
9. Connect cables:- It is the cables are keyed so they will only fit in one direction into the board, the cable that is attached to the optical drive.
10. Install RAM:- If your computer uses more than one stick refer to the manual for which slot to install the stick.
11. Install graphics card & Expansion cards:- If your computer does not come with a graphics card integrated into the motherboard, then insert one.
12. Find product:- The assembly of a brand new computer can take several hours just to remove and mount in a case.

② Explain how trouble shooting a system helps to trace and correct failure in the system.

Ans. Troubleshooting is a systematic approach to problem solving that is often used to find and correct issues with complex machines, electronics, computers and software systems.

The first step in troubleshooting is gathering information on the issue, such as undesired behavior or a lack of expected functionality. Other important information includes related symptoms and special circumstances that may be required to reproduce the issue.

Once the issue and how to reproduce it are understood, the next step might be to eliminate unnecessary components in the system and verify that the issue persists, to rule out compatibility and third-party causes.

Continuing, assuming the issue remains, one might next check common causes. Depending on the particular issue and the troubleshooter's experience, they may have some ideas. They may also check product documentation and/or conduct research on a support database or through a search engine.

③ Test out the procedure to install extra memory card to a system.

Ans. ① Dis connects the power cable from your system and if needed, unplug other back-panel cables so that you can safely turn your system onto its side.

- ③ List out the procedure to install extra memory card to system.
- Ans
- Step 1:- disconnect the power cable from the system and if needed, unplug other back-panel cables so that you can safely turn your system on to its side.
  - Step 2:- Remove the side panel to give you full access to the interior and locate the RAM slots. They're most commonly found next to the processor and its corner. If there's already RAM in your system, eject it by pressing firmly on the tabs on the motherboard at either end of the slots. The memory stick will pop out and you can remove them gently.
  - Step 3:- To install the new RAM, line up notches in the bottom of the stick in gaps in the slot on the motherboard. As it does the wings will clamp in and hold the memory securely.
- Step 4:- Once the sticks have clicked into, confirm that the wing-clips are locked into hold the sticks firmly in their slots and close the PC back up. plug all the cables back in and try to boot the system.
- ④ Explain, with neat diagrams, various cables used to connect functional units in a system.
- 1) VGA Cable:- Also known as D-sub cable, analog video cable. Connect one end to computer, monitor, television. Connect other end to VGA port on computer.
  - 2) DVI Cable:- Connect one end to computer, monitor connect other end to DVI port on computer.
  - 3) HDMI Cable:- Connect one end to computer, monitor, television. Connect other end to HDMI port on computer.

Subject:	COA Lab	Subject Code:	

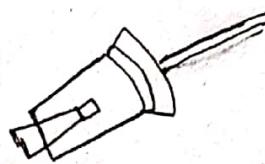

- 4) PS/2 Cable:- Connect one end to PS/2 Keyboard, PS/2 mouse. Connect other end to PS/2 ports on computer. Purple PS/2 port keyboard.
- 5) Ethernet cable:- Connect one end to router, network switch. Connect other end to Ethernet port of computer.
- 6) USB cable:- Connect one end to USB device, connect other end to USB ports on computer.
- 7) Computer power cord (Kettle plug) - Connect one end to AC power socket. Connect other end to power supply unit, computer monitor.

USB cable

(4) Write out various cables.

(5) List out safety precautions while disassembling the components from the system.

Ans. A few warnings and reminders before you start disassembling your computer.

1) Fully shutdown and unplug the computer before you make any attempts to disassemble the case.

2) Take off any metal objects on your arms or fingers such as bracelets, rings or watches. Even if unit is unplugged there may still be some remaining electric charge.

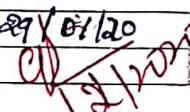

- 3) Make sure your hands are completely dry to avoid damaging any mechanical parts as well as to avoid electrocution.
- 4) Work in a cool area to avoid perspiration for the same reason as seen in the previous one.
- 5) Before touching any part within the case, put your hands against another metal surface to remove static charge, which may damage sensitive devices.
- 6) Prepare a place to keep any screws you may remove.
- 7) Handle all parts with care.
- 8) If a component doesn't come easily, do not forcefully remove it.
- 9) Be careful when handling the mother board.
- 10) Never attempt to remove the power source, a box attached to the side of the unit to which all cables are connected.
- 11) When removing any cables, wires or ribbons, make use of, grasp the wire at its back or head to keep it from breaking.
- 12) Be careful not to drop any small parts into unreachable areas, such as into computer fan or disk drives.
- 13) Take note that there must be three most damaging things to computer are moisture, shock, and dust.

Department of CSE

Tutorial -II

Programme: B.E  
Course: Computer Organization Course Code: CS45

Term: Jan to May 2020

Name: Moulidha .B	Marks: 10/10	Date: 29/01/20
USN: IMS18CS075	Signature of the Faculty:	

**Activity II:** Demonstrating Datapath and instruction execution stages using MarieSim Simulator

**Objective:** To simulate inter communication between CPU and memory.

**Simulator Description:** MarieSim is a computer architecture simulator based on the MARIE architecture. It provides users with interactive tools and simulations to help them deepen their understanding of the operation of a simple computer. One can observe how assembly language statements affect the registers and memory of a computer system.

**Activity to be performed by students:**

1. Draw the interconnection between memory and a processor.

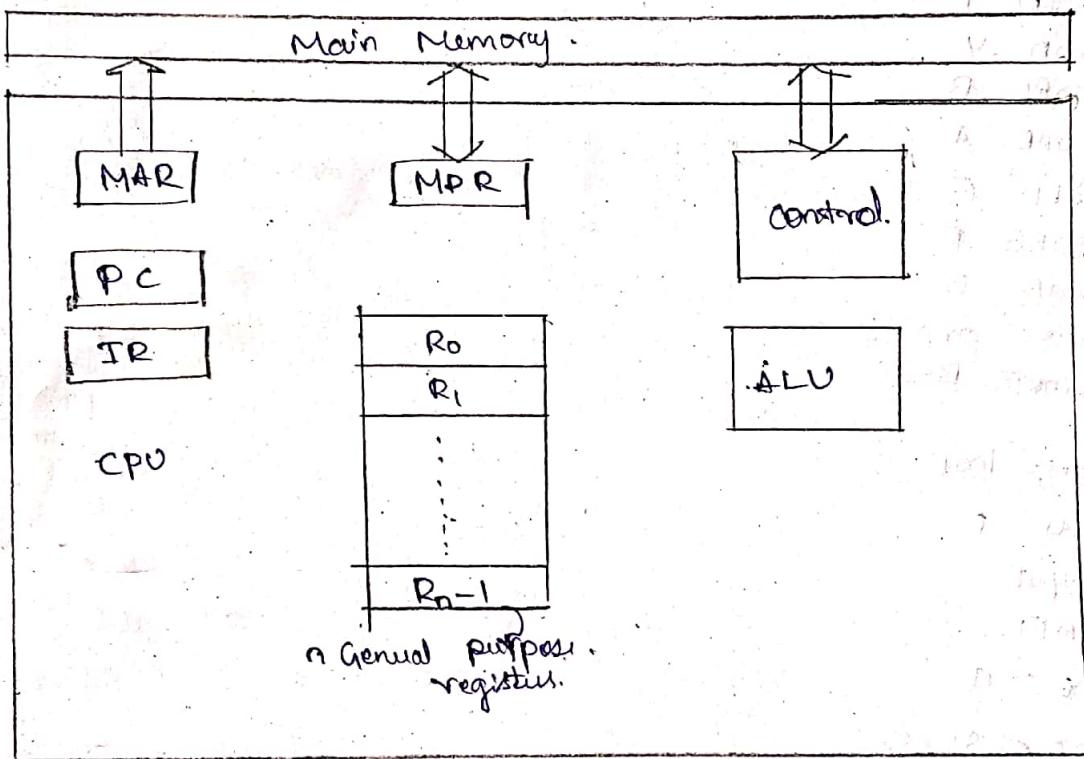

**MARKS :**

**Activity - II**

Name :	MOULIDHAR NB	Branch:	CSE
USN/Roll No. :	1MS18CS075	Sem/Sec:	IV / B
Subject :	COA Lab	Subject Code:	

- ① Draw the interconnector between memory and processor.

Ans:-

- ② List out the steps required to execute an instruction.

Ans:- There are 6 steps involved in the execution of an instruction.

- ① Fetch instruction
- ② Decode information
- ③ perform ALU operation.

- ④ Access memory.
  - ⑤ update register file.
  - ⑥ update the program counter (PC)
- ③ Write and execute the assembly language program to compute

(i)  $f = (g+h)^*(i+y)$

Ans:-

```

LOAD G
ADD H
STORE A
LOAD I
ADD Y
STORE B
loop LOAD A
ADD F
STORE F
LOAD B
SUBT ONE
STORE B

```

JUMP loop

LOAD F

OUTPUT

HALT

G DEC 9

H DEC 5

I DEC 8

A DEC 2

B DEC 0

F DEC 0

one DEC 1

(ii)  $d = b^2 - 4ac$

Ans : LOAD B  
STORE O  
LOAD B  
ADD X  
STORE X  
SUBT one  
STORE O

JUMP first

Second LOAD  
ADD 4  
STORE 4  
LOAD C  
SUBT one  
STORE C

JUMP second

third LOAD four  
ADD 2  
STORE 2  
LOAD 4  
SUBT one  
STORE 4

Jump third

LOAD D  
ADD X  
SUBT 2  
OUTPUT  
HALT  
A DEC 6  
B DEC 3  
C DEC 2  
D DEC 0  
X DEC 0  
Y DEC 0  
Z DEC 0  
D DEC 0  
one DEC 1  
four DEC 4

(ii) Describe the factors affecting the performance of a processor  
Ans : There are few factors affecting the performance of a processor.

\* Multiple cores :- Nowadays we have dual, quad and even octa core processors with its own fetch and execute cycles. However, the software should make use of the multiple cores.

- \* Clock Speed: - The processor requires a clock pulse in order to operate correctly. one clock cycle =  $1 \text{ Hz} = 1 \text{ pc}$ . Clock speed is normally in the GHz region.
- \* Cache memory: It is a small amount of high performance RAM that is built into the processor. This RAM stores the data which has to be repeatedly used by the processor and it does not require a request from memory.
- \* Word length: the no. of bits the CPU can process simultaneously. For example, a 32-bit processor is faster than a 16-bit processor because of the wider word length.
- \* Address Bus width: It is the width of the address bus and determines the maximum amount of addressable locations. For example, an address bus of 8 bits means that you can have 256 addresses (0 to 255).
- \* Data Bus width: It is the no. of bits that can be transferred simultaneously from one device to another. If the data bus is 16 bits and the address bus is 32 bits, so the data is fetched in  $2 \times 16$  bit groups.

Assembly listing for: PROG1.mas

Assembled: Tue Jan 28 06:35:41 IST 2020

000	1004		LOAD X

**Objective:** To simulate ARM Instruction set using ARMsim simulator.

**Simulator Used:** ARMSim 1.91 is a desktop application running in a Windows environment. It allows users to simulate the execution of ARM assembly language programs on a system based on the ARM7TDMI processor.

ARM enables the users both to debug ARM assembly programs and to monitor the state of the system while a program executes.

**Activity to be performed by students:**

- 1) Write an ARM program to perform basic arithmetic operations.
- 2) Write an ARM program to demonstrate the working of load and store instructions.
- 3) Write an ARM program to evaluate expression  $f=(g+h)-(i+j)$
- 4) Write an ARM program to find the sum of all elements of an array.
- 5) Write an ARM program to find the factorial of a number.

**Programs and the snapshots:**

## Activity II

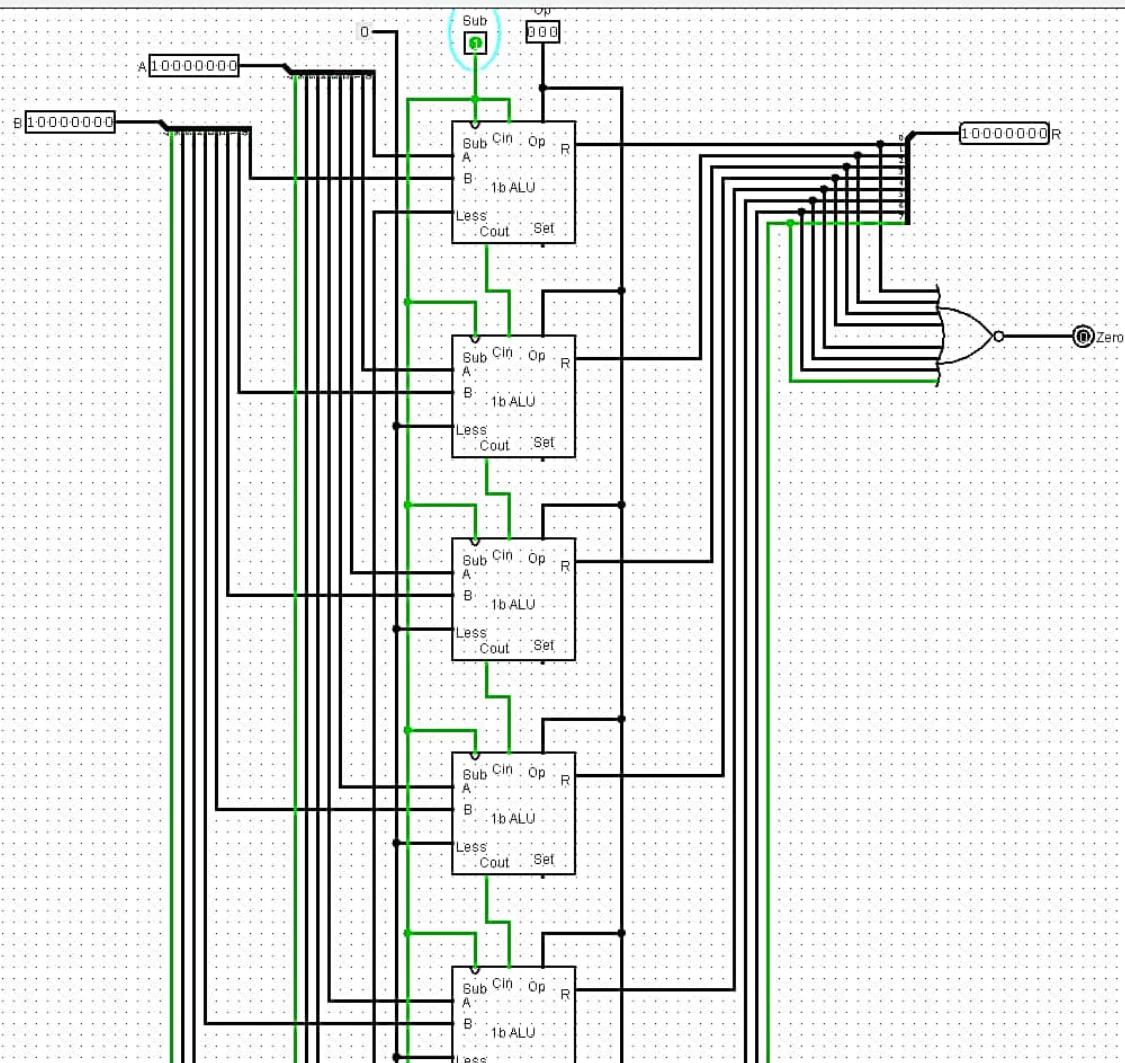

Objective: To simulate the working of Arithmetic and Logical unit using simulator.

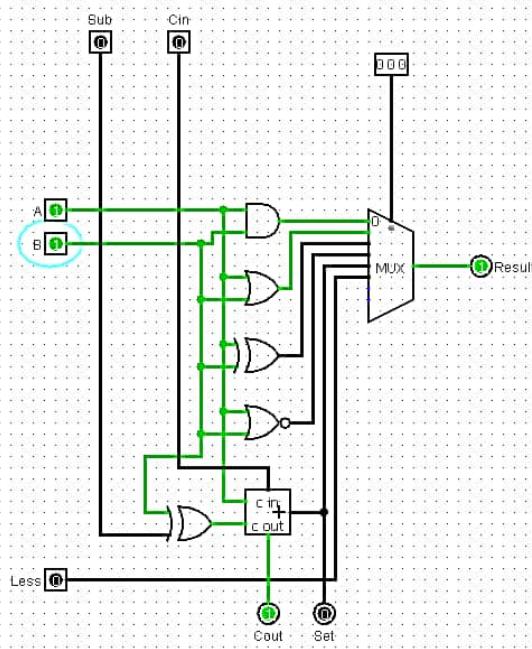

The steps in design

Simulator Description: Logism is an educational tool for designing and simulating digital logic circuits. With its simple toolbar interface and simulation of circuits as you build them, it is simple enough to facilitate learning the most basic concepts related to logic circuits. With the capacity to build larger circuits from smaller sub circuits, and to draw bundles of wires with a single mouse drag, Logism can be used to design and simulate entire CPU's for educational purposes.

Steps in designing ALU:-

1. Add the two i/p pins. Name them A & B
2. Add or, and, ex-or, nor gates and a 1-bit adder.
3. Connect the A's and B's of all the gates to their respective pins
4. Add an output pin and name it result.
5. Add a 1-bit multiplexer with 3 select bits.
6. Connect outputs of all the gates to the mux.
7. Connect 3-bit input pin to mux.
8. Add i/p pin to cin, and output pin to cout.
9. Add an ex-or gate connect its O/P to cout. The first i/p must to connected B and the second to another i/p pin sub.
10. Add another i/p and name it lsr. Connect it to the mux.
11. Add an output pin and name it Set, connect it to the O/P of adder unit.

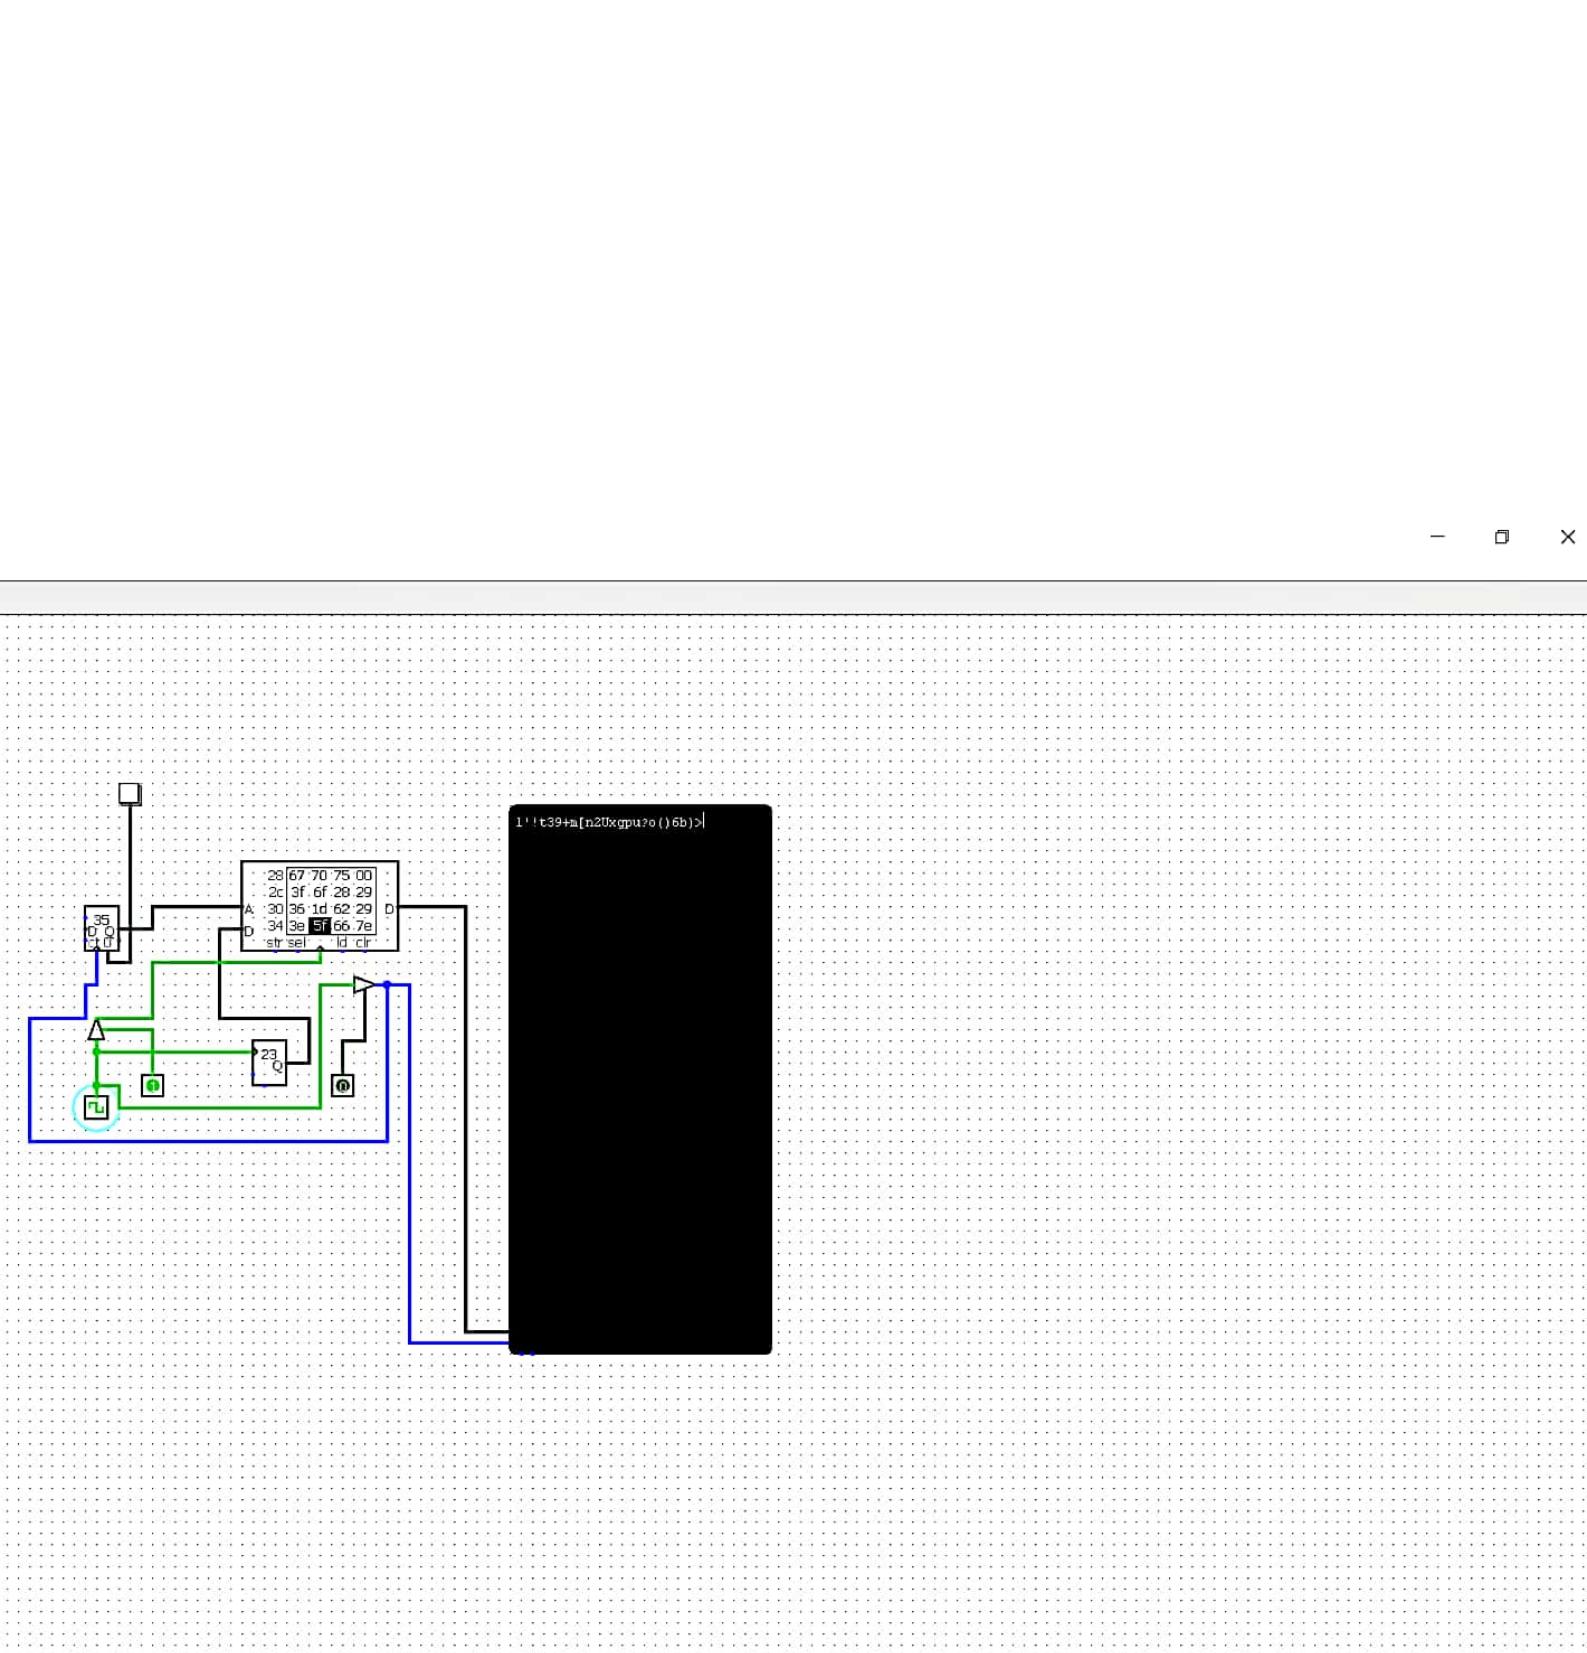

Objective: To simulate the writing operation on memory.

Simulator description:- Logism is an educational tool for designing and simulating digital logic circuits. With its simple toolbar interface and simulation of circuits as you build them, it is simple enough to facilitate learning the most basic concepts related to logic circuits. With the capacity to build large circuits from smaller sub circuits, and to draw bundles of wires with a single mouse drag, Logism can be used to design and simulate entire CPUs for educational purposes.

The steps in designing memory system:-

1. Add a RAM with separate load and store selected.
2. Add a counter and connect Q to A of the RAM.
3. Add a controlled buffer and connect its O/P to the RAM.
4. Add a clock and connect to the i/p of the buffer.
5. Add a TTY unit with 32 rows and columns. Make the connections with RAM.
6. Add a 7-bit random number generator, connect Q to P.
7. Add another controlled buffer, connect it to TTY. Also add an i/p pin to the buffer.
8. Connect the o/p of the second buffer to the counter.
9. Connect a button to the counter.

## Activity VII

Objective :- To learn and analyse the performance of the CPU by overlapping of instructions using, CPU-SIM Simulator.

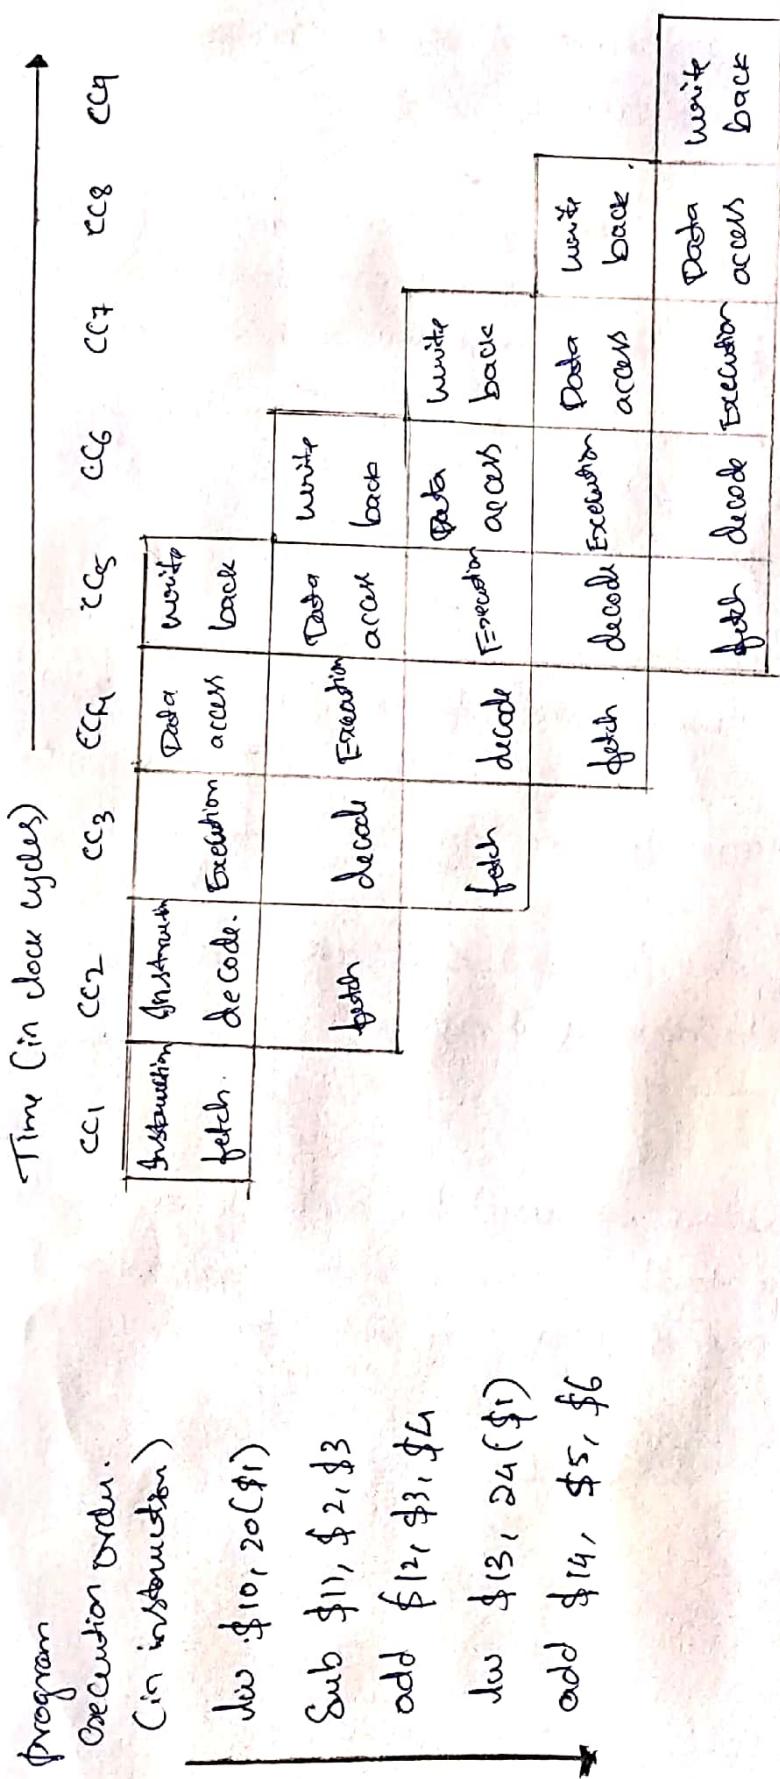

Simulator used :- CPUS-SIM is a software development environment for the simulation of simple computers. It was developed by Dale Skinner to help users to understand computer architectures.

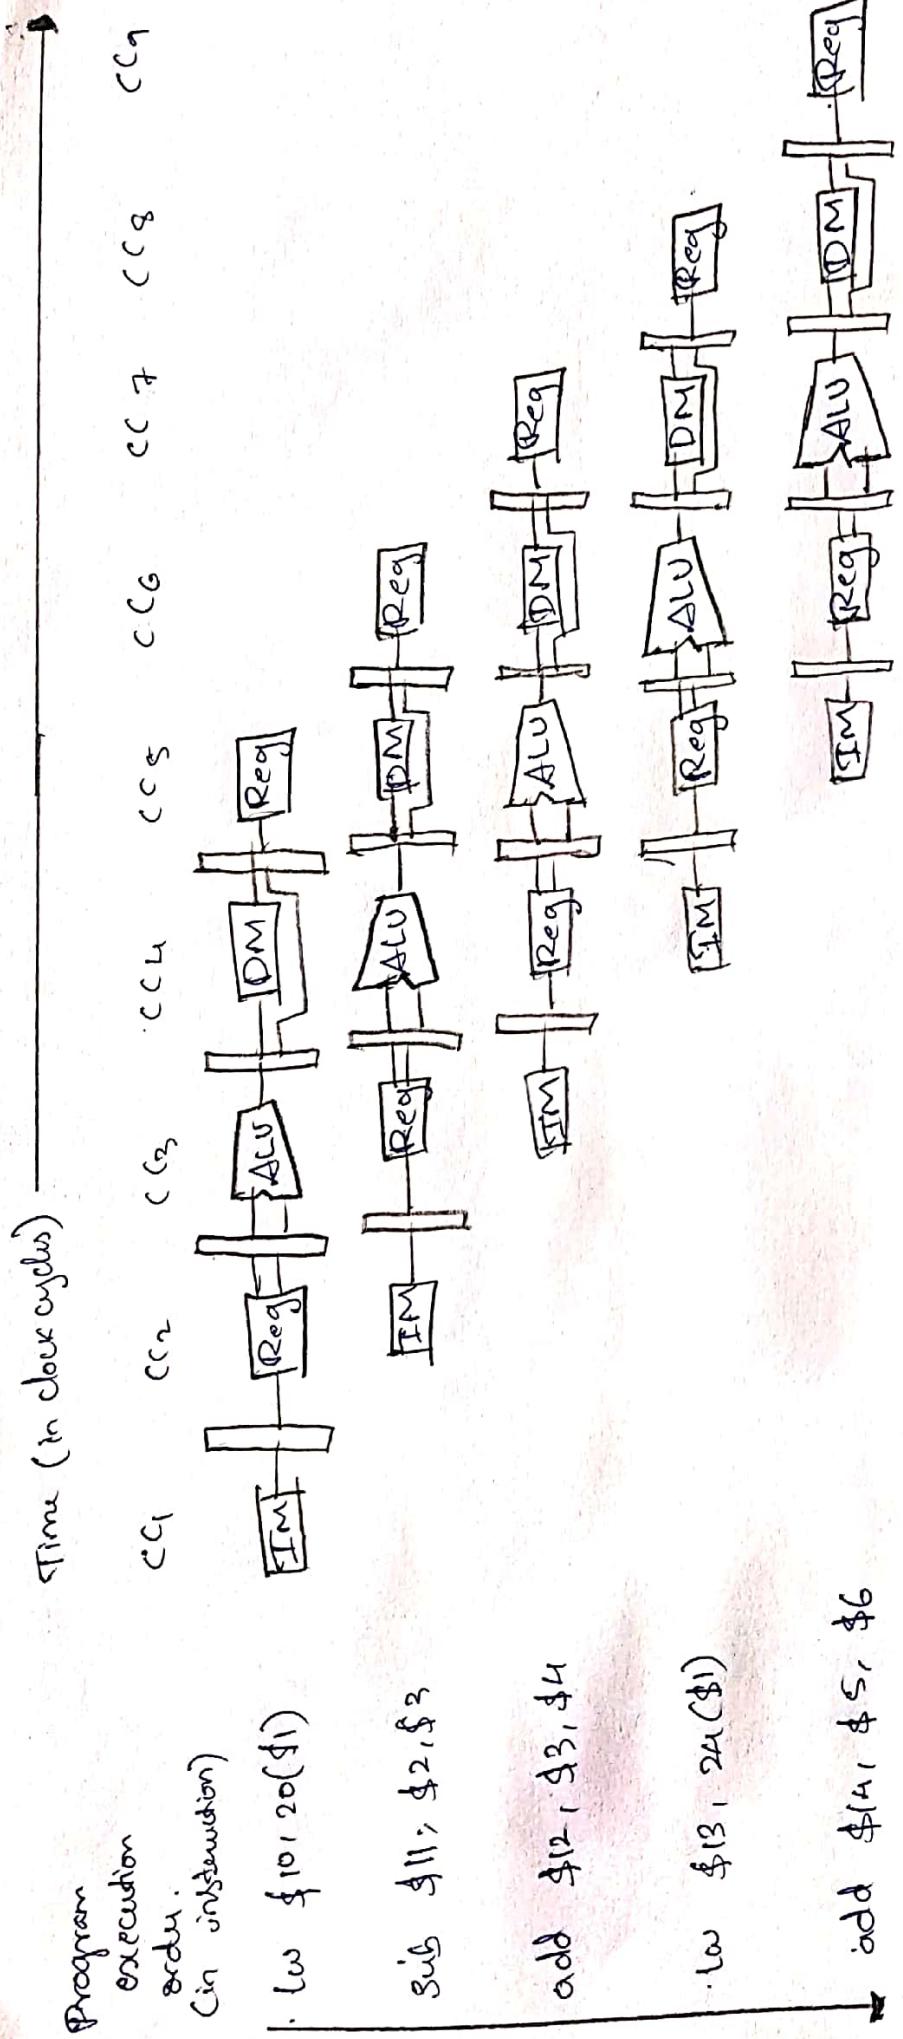

Modern CPU's contain, several, semi-independent circuits involved. In decoding & executing each machine instruction - separate circuit elements perform each of these typical steps :-

- \* Fetch the next instruction from memory into an internal CPU register.
- \* Decode the instruction to determine which function sub-circuits it requires.
- \* Read any input operands required, from high speed registers or directly from memory.
- \* Execute the operation using the selected sub-circuits.
- \* Write any output results to high-speed registers or directly to memory.

Separate sections of the CPU circuitry are used for each of these steps. This allows these circuit sections to be arranged into a sequential pipeline, with the output of one step feeding into the next step.

with diagram demonstrate the execution of the following instruction using pipelining technique.
